

Installation of 200-meter optical cable

Article Overview

A 200-meter optical fiber cable should be installed using careful handling, proper pulling techniques, figure-eight coiling, and manhole placement to prevent damage and ensure optimal performance.

Pre-Installation Preparation

- **Site Inspection:** Ensure the installation area is clear of debris, sharp objects, and obstacles that could damage the cable .
- **Manholes:** For a 200-meter run, provide at least one manhole for pulling and splicing. Manholes should be clean, properly sized (typically 1000x1000x1000 mm), and positioned at every 200 meters or at any 90-degree bend .
- **Equipment Check:** Verify that all lifting and pulling equipment is rated for the cable weight and in good condition. Use lifting slings at a 45° angle for drum handling .
- **Cable Inspection:** Check the cable for continuity, insulation resistance, and any physical damage before installation .

Cable Handling and Pulling

- **Drum Handling:** Pull the cable from the bottom of the drum to avoid twisting .
- **Figure-Eight Coiling:** Lay the cable in figure-eight loops (2-4 meters for typical cables) to prevent twisting and kinking . Each loop should be slightly offset from the previous one.
- **Bending Radius:** Never bend the cable below its minimum bend radius, typically 15 times the cable diameter for working radius . Avoid sharp turns and edges.
- **Lubrication:** Apply approved cable lubricant if necessary to reduce friction during...
