

Installation of RRU on Communication Towers

Overview

Optimizing RRU placement involves three key steps: Vertical Positioning: Mount RRUs within 3-5 meters of antennas to limit feeder cable losses. Fiber Prioritization: Use fiber-optic cables instead of coaxial lines for BBU-RRU connections, cutting signal attenuation by 90%. How to Plan an Efficient Communication Tower Equipment Layout?

Remote Radio Units or RRUs play an important role as transceiver parts within today's Base Transceiver Station systems. These units are separated from baseband equipment so they can work within distributed radio access networks. RRU (Radio Remote Unit) and BBU (Building Baseband Unit) are indispensable components in base station construction and FTTA. In a distributed base station. This feature is controlled by a Remote Control Unit (RCU), which communicates with the Remote Radio Unit (RRU). They play a critical role in maintaining signal quality by minimizing loss and. This document describes the process of installing a DC blade RRU3261 (referred to as RRU in this document). Filtering and amplification of RF signal. Decides the coverage of the power capability.
