

Installation process of fiber distribution box

Article Overview

Installing a fiber distribution box involves careful site selection, secure mounting, proper cable routing, fiber termination, and thorough testing to ensure reliable network performance.

1. Site Selection and Preparation

Choose a location that is dry, ventilated, and free from potential water leaks or high-voltage interference. For indoor installations, the bottom of the box should typically be 1.2–2.5 meters above the ground, while outdoor installations are usually 2.8–3.2 meters above ground. Avoid unstable walls, temporary structures, or areas with heavy pedestrian traffic. Ensure the site allows easy access for maintenance and cable routing, and meets safety regulations and environmental requirements .

2. Mounting the Distribution Box

- Wall-mounted boxes: Use expansion bolts to secure the box firmly, ensuring it is level and perpendicular with a deviation of no more than 3mm .
- Rack-mounted boxes: Install brackets on both sides of the box and fix them to the designated rack position with screws, ensuring proper orientation for cable access .
- Outdoor cabinets: Ensure the cabinet is stable, can withstand environmental stress, and is placed near FTTH access nodes for optimal performance .

3. Introducing and Routing Fiber Cables...
