

# Is there any data on international optical cables

## Overview

OpenFiberMap aggregates open-licensed datasets (AfTerFibre, OFDS, PeeringDB, and others) into a single interactive globe, visualizing routes by capacity tier, operational status, and operator. The exchange of data in the blink of an eye has become a given in much of the world – and yet we rarely pause to think about what makes it all possible: a complex global network of cables in the depths of the ocean that silently connects us. In the modern information age, undersea cables have. Internet Exchange Point — neutral facility where networks interconnect and exchange traffic. Use the controls at the top to play the animation or step through year by year. ” Physical glass cables on the ocean floor carry the bulk of intercontinental traffic—which is why chokepoints and cable cuts can slow (or sometimes partially disrupt) entire regions. As digital economies expand and geopolitical tensions shape technological dependencies, undersea cables emerge not. More than 99% of international data traffic travels through these subsea cables, which remain the most efficient way to send information across the ocean.
