

Lithuanian Optical Cable Winding Tube Installation Solution 1200mm Depth

Article Overview

A 1200mm deep optical cable winding tube installation can be efficiently achieved using loose tube fiber cables, spiral protective tubing, and motorized winding machines designed for large-diameter rings.

Cable Selection and Handling

For installations at 1200mm depth, loose tube optical fiber cables with a polyethylene (PE) outer jacket are recommended for durability and direct burial suitability. The load during pulling must be applied to the cable's strength members, not the fibers themselves, to prevent elongation or damage. Use a specialized pulling grip of at least 600mm to distribute tension evenly, and cut off approximately 3 meters of cable after pulling to remove any stressed sections before termination (Aginode guidelines) .

Protective Tubing and Spiral Wrapping

To protect and organize the optical fibers within the winding tube, spiral wrapping or protective tubing is essential. Spiral wraps made of high-abrasion-resistant PE provide flexibility, UV resistance, and allow selective breakout of fibers for rerouting or maintenance. HellermannTyton and similar suppliers offer spiral cable organizers in various diameters and materials suitable for optical cables, ensuring strain relief and preventing tangling
