

Main cable of distribution box

Article Overview

The main cable is the primary feeder that brings electrical power into a distribution box, connecting to the main switch or MCB and distributing power to all sub-circuits.

Purpose and Function

The main cable serves as the primary power supply to the distribution box (DB). It carries the full load current from the service panel or utility supply and connects directly to the main MCB or main switch, which controls and protects the entire distribution system. In modular or industrial systems, this cable may also connect to a Main Distribution Box (MDB), which then feeds secondary distribution boxes or floor modules via extender cables.

Cable Sizing

The cross-sectional area of the main cable must be sufficient to handle the total anticipated load. For example, in a domestic single-phase 230V system with a 60A main MCB, a 16mm² copper cable is typically used for both phase and neutral wires. Proper sizing ensures the cable can safely carry the current without overheating or voltage drop.

Connection and Protection

In domestic setups, the main cable is connected to a double-pole MCB (main switch) and then routed through an RCCB for additional protection against leakage currents and electrical shocks. In industrial or modular systems, the main cable often termin...
