

Methods for remotely accessing the core switch

Article Overview

You can remotely access a core switch using SSH, Telnet, or a web-based interface, with SSH being the most secure method.

Prerequisites

Before attempting remote access, ensure the following:

- The switch is a managed switch with remote access capabilities enabled .
- The switch has a valid IP address assigned to its management interface or VLAN interface .
- SSH or Telnet services are enabled on the switch if using CLI access .
- You have valid login credentials with administrative privileges .
- Your computer is on the same network or has proper routing to reach the switch's IP address .

Access Methods

1. SSH (Secure Shell)

SSH is the recommended method for remote access due to its encryption and security:

- Enable SSH on the switch, configure hostname, domain name, and generate RSA keys
