

On-site installation of embedded power distribution box

Article Overview

Embedded power distribution boxes must be installed with precise alignment, proper mounting height, environmental protection, and compliance with electrical standards to ensure safety and functionality.

Site Preparation and Mounting

Before installation, ensure the wall or structure is prepared to accommodate the embedded box. The bottom edge of the box should be approximately 1.5 meters from the floor, and the installation board should be at least 1.8 meters from the ground for accessibility and safety . The box must be plumb and level, with deviations not exceeding 3mm, and the edges should align flush with the wall surface without protruding or being recessed . For boxes wider than 500mm, concrete lintels should be installed above the box to prevent structural pressure; for widths over 300mm, reinforced brick lintels are recommended . Surround the box with cement mortar to secure it in place.

Environmental Protection and Standards

Select a distribution box with an appropriate IP rating based on the installation environment. For indoor installations, IP2X may suffice, while outdoor or washdown areas require IP66, IP67, or IP69K for dust, water, and high-pressure cleaning protection . Apply anti-corrosion paint to parts of the box in contact with walls or structures to prevent degradation over time . Ensure sufficient clearance around th...
