

One fiber optic cable can support two routers

Article Overview

Yes, one fiber optic connection can support two routers, but typically through a primary router that manages the internet connection, with the second router extending or segmenting the network.

How It Works

A fiber optic line delivers internet to your home via an Optical Network Terminal (ONT), which converts light signals into Ethernet for your router. Most ONTs provide a single public IP address from your ISP, meaning only one device can directly manage the internet connection without conflicts. Connecting two routers directly to the ONT is generally not recommended unless your ISP provides multiple IP addresses.

Practical Methods

- Primary and Secondary Router Setup
- Connect the first router to the ONT; it acts as the main gateway, handling IP assignment, firewall, and internet management.
- Connect the second router to a LAN port of the first router. Configure it in Access Point mode or as a secondary network to extend Wi-Fi coverage or provide additional Ethernet ports.
- Assign a static IP to the second router within the same subnet to avoid conflicts.
- Using a Switch for Multiple Routers...
