

Optical transmitter catv

Article Overview

Optical transmitters in CATV systems convert RF signals into optical signals for high-quality, long-distance distribution over fiber networks.

Overview

Optical transmitters are key components in CATV fiber optic networks, enabling the transmission of analog and digital TV signals, QAM, and broadband RF signals over long distances with minimal loss. They convert electrical RF signals into optical signals using lasers, which are then transmitted through single-mode or multi-mode fiber to distribution nodes or subscribers .

Types of Optical Transmitters

- Directly Modulated Transmitters (DMOD)
 - Use a distributed feedback (DFB) laser directly modulated by the RF signal.
 - Commonly operate at 1310 nm for upstream or short-distance downstream applications.
 - Example: POLYTRON OT 1200 series supports up to 1218 MHz bandwidth, DOCSIS 3.1 compatible, ideal for headend hubs .
- Externally Modulated Transmitters (EMT)
 - Use a continuous-wave DFB laser with an external modulator (e.g., LiNbO3) to encode the RF signal.
 - Operate at 1550 nm, suitable for long-distance transmission due to lower fiber attenuation.
 - Provide low noise, high linearity, and minimal CSO/CTB distortion....
