

Pigtail head making machine

Article Overview

Pigtail head making machines are specialized industrial tools designed to form pigtail-shaped ends on materials such as rebar, wire, fiber optic cables, or coil springs, available in manual, semi-automatic, and fully automatic models.

Types and Applications

1. Rebar Pigtail Machines: These machines are used in construction to twist and secure the ends of steel reinforcing bars (rebar) into tight loops, enhancing structural integrity in concrete projects. Fully automatic models use programmable logic controls (PLCs) and sensors to detect bar size, apply the correct torque, and produce hundreds of pigtails per hour, making them ideal for large-scale precast concrete plants. Semi-automatic and manual versions are suitable for smaller sites or custom fabrication, offering more control but lower output . 2. Wire and Screw Hook Pigtail Machines: Used in manufacturing wire hangers, screw hooks, and other bent wire products, these machines can form pigtail shapes with threading functions. They are designed for high efficiency, reliability, and long lifespan, often integrated into complete production lines for coated or shaped wire products . 3. Fiber Optic and Cable Pigtail Machines: These machines create pre-terminated fiber or copper pigtails for networking and telecommunications. They automate cutting, stripping, and forming pigtail ends, ensuring consistent quality and high-speed production for data cabling applications . 4. Coil Spring Pigtail Machines: In coil spring manufacturing, pigtail head machines form the ends of springs into precise pigtail shapes. The process is automated using a forming jig that moves according to a pre-set program. The machine can be installed near coiling machines, and after forming, springs are transferred to quenching or further processing stages
