

PoE switch green light

Article Overview

A solid green light on a PoE switch generally indicates that the switch or port is powered and operating normally, while a blinking green light usually signals activity or power delivery issues.

Power and System Indicators

- **Power Indicator (PWR):** A solid green light means the switch is receiving power and is functioning correctly. If the light is off, the switch may not be powered, or there could be a power supply issue .
- **System Status (SYS):** A solid green light indicates the system has completed startup and is running normally. A blinking green light shows the system is in the process of starting up .

PoE Port Indicators

- **Solid Green:** The port is providing PoE to a connected device, and the device is receiving power successfully .
- **Blinking Green:** This may indicate that the connected device is drawing more power than the port can supply, or the device is not fully compliant with PoE standards. It can also indicate data activity on the port .
- **Off:** If the port LED is off when it should be on, the port may not be supplying power due to a faulty cable, a non-PoE device, or a configuration issue .
