

Power supply restored after the distribution box trips

Article Overview

To safely restore power after a distribution box trips, first identify the tripped circuit, reset the breaker, and check for overloads or faulty devices before gradually reconnecting power.

Steps to Restore Power

- **Ensure Safety First** Before touching the distribution box, turn off the main power to prevent electric shock or further damage to the system .
- **Identify the Tripped Circuit** Open the distribution box and locate the breaker that is in the middle or “off” position. This indicates the circuit that caused the trip .
- **Reset the Breaker** Switch the tripped breaker fully to “off”, then firmly back to “on” . For GFCI or AFCI breakers, a manual reset may be required after a power outage .
- **Check for Overloads or Faulty Devices** If the breaker trips immediately after resetting, unplug all devices on that circuit. High-draw appliances like refrigerators, air conditioners, or computers can create a momentary surge (inrush current) that trips the breaker .
- **Gradual Reconnection** Turn on or plug in devices one at a time, waiting about 60 seconds between each to identify any device causing repeated trips .
- **Inspect Wiring and Connections** Ensure all wires and DIN terminal clasps are properly installed, with no insulation trapped under the terminals. Check for loose, damaged, or shorted wires that could cause repeated trips .
- **Call a Licensed Electrician if Needed** If the breaker continues to trip after isolating devices, or if you notice burn marks, melted plastic, or unusual sounds, contact a professional. Persistent trips may indicate a sustained overload, ground fault, or da...
