

# Principle of Relay Protection Malfunction Wiring

## Overview

Differential Relay: Compares currents at two points; operates when there is a difference (used in transformers and generators). Earth Fault Relay: Detects leakage currents to the. When the transformer wiring type is Y/Y (Y0), the test wiring is very simple: when testing phase A, the tester IA is connected to the phase A of the high voltage side, and the tester IB is connected to the phase a of the low voltage side. After the neutral line of the high and low voltage sides is. It covers the protection methods for generators, transformers, buses, and transmission lines using various relay types to detect and isolate faults efficiently. Currently residing in Denver, Colorado. Previous experience in designing low voltage and medium voltage switchgear, relay panels and custom control panels as an Electrical Engineer at ESSMetron, Denver CO. It functions as a watchdog by constantly surveying multiple system components including voltage, current, frequency, and phase angle.
