

Removing fiber optic cable filler

Article Overview

Fiber optic cable filler can be safely removed using precision stripping tools while following proper safety precautions to avoid damaging the fibers.

Understanding Fiber Optic Cable Fillers

Fiber optic cables often contain filler rods or yarns to maintain the cable's shape and protect the fibers from stress. These fillers are typically made of plastic or dielectric materials and are located between buffer tubes or around the central strength member. Removing them is necessary when preparing the cable for splicing or connectorization, but care must be taken to avoid nicking or breaking the delicate glass fibers inside (Corning Cable Systems) .

Tools for Removing Fillers

Specialized fiber optic stripping tools are recommended for removing fillers and cable jackets. Options include:

- Mechanical fiber strippers: Handheld tools with precise blades for cutting and removing fillers and coatings without damaging fibers .
- Round cable strip & ring tools: Designed for larger cables, allowing longitudinal, spiral, or circular cuts to remove fillers and jackets efficiently .
- Adjustable cable strippers: Tools like the Kabifix LK25 allow controlled circular or longitudinal cuts for plastic tubes and fillers, with interchangeable blades for precision
