

Repairing spliced optical cables

Article Overview

Fiber optic cables can be effectively repaired using fusion or mechanical splicing, combined with proper protection and testing to ensure low-loss, reliable connections.

Safety and Preparation

Before starting any repair, wear appropriate eye protection to prevent injury from fiber shards, which are invisible and extremely dangerous. Gather all necessary tools and materials, including fiber strippers, cleavers, crimpers, splicing equipment, and protective sleeves, to avoid repeated handling and contamination of the work area . Ensure there is sufficient slack in the cable to work comfortably without stressing undamaged sections .

Fault Detection

Locate the break or damaged section using:

- Optical Time Domain Reflectometer (OTDR): Sends light pulses through the fiber to detect breaks, bends, or reflective losses .
- Visual Fault Locator (VFL): A handheld device that emits visible red light, making breaks or bends glow for easy identification .

Preparing the Fiber

- Trim damaged ends: Use a fiber optic cutter to remove frayed or damaged sections .
- Strip the protective coating: Carefully remove the outer jacket, buffer, and Kevlar...
