

Replacement of Telecom Fiber Optic Routers

Article Overview

To replace a fiber optic router, connect your compatible router to the ISP-provided ONT, configure settings, and ensure it supports your fiber plan's speeds.

Step 1: Check Compatibility

Fiber internet uses an Optical Network Terminal (ONT) instead of a traditional modem. Your new router must have a Gigabit Ethernet WAN port to connect to the ONT and support the speed tier of your fiber plan. Routers designed for DSL or cable won't work, and older Wi-Fi 4 or Wi-Fi 5 routers may limit performance. A Wi-Fi 6 or 6E router is recommended for optimal speed and device management .

Step 2: Prepare for Replacement

- Contact your ISP to confirm any restrictions and to arrange the return of the existing router to stop rental fees .
- Choose a central location for your new router to minimize dead zones and avoid obstructions like metal, concrete, or brick .
- Remove physical obstacles and ensure antennas are properly connected and extended if applicable .

Step 3: Connect the Router

- Ensure the ONT is active and connected to the fiber line.
- Use an Ethernet cable to connect the ONT to the router's WAN port
