

Requirements for Angle Steel for Cable Tray Fixing Brackets

Article Overview

Angle steel for cable tray fixing brackets must be made of corrosion-resistant steel, sized to support the tray load, and installed according to spacing and fastening standards.

Material and Corrosion Protection

Angle steel used for cable tray brackets is typically mild steel, galvanized steel, or stainless steel depending on environmental conditions . Galvanization (pre-galvanized or hot-dip) is recommended for protection against corrosion, especially in industrial or outdoor environments . Stainless steel grades such as AISI 316L are preferred in highly corrosive or chemical-prone areas . The steel must withstand mechanical loads, including the weight of cables and any additional forces such as wind or seismic activity .

Dimensions and Load Capacity

The thickness and size of the angle steel are determined by the cable tray width, tray height, and expected cable load. Standard support constructions, such as the RS 60 system, use angle steel brackets capable of supporting trays with rail heights of 60 mm and widths from 100 to 300 mm . Brackets must be designed to handle the maximum permissible cable dead weight and maintain structural integrity over the support span....
