

Rust on the surface of the distribution box

Overview

The application of nanomaterial coatings enhances durability, while surface preparation and moisture control reduce electrochemical corrosion risks. Regular inspections, IoT monitoring, and adherence to industry standards are essential for maintaining coating integrity. In order to prevent the rust of the distribution box, the following measures can be taken: Choose anti-rust materials: choose corrosion-resistant and anti-rust materials, such as stainless steel or galvanized steel sheets, to ensure that the surface of the cabinet is not easy to rust. Surface. Rust can weaken an electrical enclosure, damage its seals, and expose internal components to moisture. Environmental conditions significantly impact.
