

Secondary power distribution box for complete sets of equipment

Article Overview

A Secondary Distribution Box (SDB) receives power from the main distribution system and distributes it to branch circuits, providing centralized, safe, and customizable power management for complete equipment sets.

Function and Role

A Secondary Distribution Box (SDB) acts as an intermediary between the main power distribution box and individual equipment or floor modules. It receives power via an extender cable from the main distribution box and distributes it to multiple branch circuits, ensuring that all connected equipment receives reliable and organized power supply (). This setup is particularly useful in modular or large-scale installations where multiple devices or systems need centralized power management.

Design and Features

- **Construction:** SDBs are typically enclosed in durable, powder-coated finishes to protect against environmental factors and mechanical damage ().
- **Customization:** They can be fitted with terminal blocks for custom wiring, allowing flexible configuration to match specific equipment requirements ().
- **Accessibility:** Designed for easy installation, maintenance, and troubleshooting, ensuring minimal downtime during operation ().
- **Ventilation:** For devices with higher power loss or heat dissipation, ventilation openings may be included to maintain safe operating temperatures ()....
