

Should I use a 100Mbps router or a gigabit router for a 100Mbps fiber optic connection

Overview

The best internet speeds for a household will primarily depend on the number of users and devices in the residence, as well as the activities most commonly enjoyed. An average household of two to four people can get by on 200 Mbps, but depending on the number of internet devices connected, they may experience high latency. “Devices” in this case mean. Basically, Mbps and Gbps are just two ways to do the same thing: measure internet speed rates. The data rate of your internet connection is measured in bits per second (bps). As data rates increase, it's easier for providers and equipment manufacturers to express speeds by the thousands. One provider may offer a 1,000 Mbps plan and another provider. To get an idea of just how much faster a gigabit of internet speed is than a typical 100 Mbps plan, you can run an entire smart-connected home with four to six heavy gamers, work-from-home users and streamers simultaneously on a 1 gig plan. A 100 Mbps plan will allow one or two users to access the internet at the same time, but only one video stream. Megabit speeds are the standard measurement for broadband connections. Remember that megabit and gigabit are just two ways to measure the same internet speed. The need for high-speed internet has increased notably since 2020, as reported by our speed data study. Trends show that the most used speed bands across the U.S. are mid-200 Mbps to 500 Mbps. Gigabit connections are often considered the gold standard for internet users, as they can support unlimited devices and users. You can shop these internet speeds with internet service providers (ISPs) that offer fiber and coaxial cable connections. At 6 Gbps, or 6,000 Mbps, Xfinity currently offers the highest speed of any major provider. AT&T and.
