

Solution Active Optical Module SFP

Article Overview

An Active Optical Module (SFP) is a compact, hot-pluggable transceiver that converts electrical signals from network devices into optical signals for fiber transmission, supporting flexible, high-speed network connectivity.

Overview of SFP Modules

An SFP (Small Form-factor Pluggable) module is a modular, hot-swappable transceiver used in switches, routers, servers, and media converters to connect to fiber optic or copper cables without replacing the host hardware . It acts as a bridge between the electronic circuitry of a network device and the physical transmission medium, converting electrical signals into optical signals (TX) and vice versa (RX), . This modularity allows for flexible deployment, increased port density, and simplified maintenance compared with fixed optics .

Types and Data Rates

SFP modules come in several variants depending on speed and application:

- SFP (1G): Standard gigabit modules for Ethernet or Fibre Channel.
- SFP+ (10G): Supports 10 Gbps data rates for high-speed networks.
- SFP28 (25G): Modern modules for 25 Gbps, often used in 100G aggregation .

Modules are also classified by fiber type:

- Single-mode fiber (SMF): Uses a 9 μm core, suitable for long-distance transmission (up to 120 km), typically operating at 1310 nm or 1550 nm .
- Multimode fiber (MMF): Uses a 50–62.5 μm core, suitable for short-range commun...
