

# Splitter attenuation is small

## Overview

The short answer: A 1×2 splitter introduces ~3. How much signal loss are you really adding when you insert a passive PLC splitter into a fiber link?

Drawing from information commonly found in technical resources and product datasheets, this guide breaks down the mechanics, quantifies the loss for every common split ratio, explains why engineers. An optical splitter, also known as an optical splitter, is a passive component used in PON (Passive Optical Network) networks such as FTTH networks. Its main function is to split an incident light signal into two or more output signals. Imagine a water hose splitting into several smaller hoses; the. Introduction: The Role of Optical Splitter in PON Network Before delving into split ratios and architectures, it's essential to ground their importance in the broader PON ecosystem. These are known as passive optical splitters, and they perform the function. Unlike their active cousins (which we discuss in active vs. They're like plumbing fixtures for signals, dividing the flow without adding any extra pressure or energy. This simplicity is a huge plus — they're. The go-to solution is often a "splitter.
