

Splitter caused disconnection

Article Overview

A disconnected Ethernet splitter usually results from loose connections, incompatible cables, or signal interference, and can be resolved by checking connections, testing cables, and ensuring proper splitter type.

Common Causes of Disconnection

- Loose or Improper Connections: Ethernet cables may not be fully inserted into the splitter, modem, or devices, causing intermittent or complete disconnection .
- Splitter Compatibility Issues: Basic splitters only support 10/100 Mbps connections and may not work with Gigabit Ethernet (10/100/1000 Mbps) networks . Using a splitter with incompatible devices or cables can prevent connectivity .
- Signal Interference or Degradation: Passive splitters divide the signal without amplification, which can reduce network speed or cause disconnections, especially over long distances or with multiple devices .
- Faulty Hardware: Over time, splitters can fail due to internal damage or wear, leading to disconnection .

Troubleshooting Steps

- Check Physical Connections: Ensure all Ethernet cables are firmly plugged into the correct ports on the splitter, modem, and devices .
- Test Cables: Use a cable tester to verify that the Ethernet cables are functioning properly and free from breaks or shorts .
- Verify Splitter Type: Confirm that the splitter supports your network speed. For Gigabit networks, consider using a network switch instead of a basic splitter .
- Power Supply (if active): If using an active splitter (Ethernet switch), ensure it is properly powered
