

Switch control for lighting in distribution box

2. Imported design is convenient for expansion.

The design of two inlets saves space and allows for rear line entry.

Article Overview

To control a switch in a lighting distribution box, you need to safely connect the switch to the circuit breaker and lighting circuit, optionally integrating automation devices like timers or sensors.

Understanding the Distribution Box

A lighting distribution box houses circuit breakers (LS switches), terminal blocks, and wiring for neutral and protective conductors. Each lighting circuit should have its own breaker to prevent overloads and short circuits, ensuring safe operation of the connected lights . Proper labeling of circuits simplifies control and maintenance.

Basic Switch Control

- Turn Off Power: Always switch off the main breaker and verify with a non-contact voltage tester that the circuit is de-energized .
- Identify the Circuit: Determine which breaker controls the lighting group you want to operate.
- Connect the Switch: For a single-pole switch, connect the incoming hot wire from the breaker to one terminal of the switch, and the outgoing wire to the light fixture to the other terminal. Connect neutral wires together and attach all ground wires to the protective conductor .
- Multiple Switches: If controlling multiple lights from one circuit, use pigtails to distribute the hot wire to each switch independently
