

The function of the polishing disc in fiber optic connectors

Overview

Polishing removes any excess epoxy or fiber stub left after cleaving, shapes the ferrule, and removes scratches in the glass, enabling an end finish that passes optical signals with minimum loss. It affects two types of optical loss—insertion loss and return loss. Fiber Polishing Machines (FPM) are special equipment used for polishing the end face of fiber optic connectors. They are usually used in the manufacturing and maintenance process of fiber optic connectors to ensure the flatness and finish of the connector end face, so as to achieve efficient. The LBTEK Manual Fiber Polishing Disc ensures secure connection of fiber connectors and maintains the proper angle for grinding ceramic ferrules.
