

The switch can display the fiber optic status

Article Overview

Yes, switches can display fiber optic status, including link connectivity, transceiver details, and real-time operational metrics.

CLI-Based Monitoring

Most managed switches allow you to check fiber optic status via command-line interface (CLI). Common commands include:

- `show interface` : Displays port link status, negotiation speed, and traffic statistics. A status of UP indicates a normal link .
- `show inventory`: Lists installed transceivers, including part number, serial number, and vendor information .
- `show interface transceiver detail` or `show interfaces transceiver detail`: Provides Digital Optical Monitoring (DOM) metrics such as transmit/receive power, temperature, voltage, and laser bias current .
- `show idprom interface` : Reads EEPROM data for transceiver identification, including type, wavelength, and supported standards . These commands allow network administrators to verify link health, detect faults, and ensure compatibility between the switch and optical modules.

Web-Based Interface Monitoring

Many switches, including Cisco Small Business and Meraki models, provide a web-b...
