

Vertical cable trays converted to parallel

Article Overview

To install vertical cable trays in parallel, maintain proper spacing, secure support elements, and ensure alignment using brackets or rails for stability and safety.

Proper Spacing and Alignment

When installing two vertical cable trays in parallel, the minimum distance between them should be at least 0.6 meters to allow for maintenance, inspection, and adequate airflow for heat dissipation, while reducing the risk of cables touching or short circuits . For floor-mounted vertical trays, a minimum vertical clearance of 150 millimeters is recommended to prevent obstruction and maintain structural integrity . Horizontal spacing between power and signal trays should generally be no less than 0.5 meters, or reduced to 0.3 meters if shielding is used to minimize electromagnetic interference .

Support and Securing

Vertical trays must be mechanically supported using wall brackets, suspended supports, or center suspensions to ensure stability . Each tray should be aligned using mounting elements or rails to keep them parallel and prevent sagging. For trays installed on edge, it is important to secure every cable to each rung to prevent sliding, but avoid overtightening cable ties to prevent insulation damage . Using vertical rail systems with hooks can help maintain cable position without relying solely on ties .
