

What are the structural components of a tray-type cable tray

Article Overview

A tray-type cable tray system consists of tray sections, fittings, supports, and accessories that together provide structured support, routing, and protection for electrical cables.

Main Components

1. Tray Sections These are the primary pathways that hold the cables and come in various designs depending on the application:

- Ladder Tray: Features two side rails connected by rungs, ideal for heavy power cables and excellent ventilation .
 - Perforated Tray: Has a solid base with ventilation holes, providing better cable support while allowing airflow .
 - Solid-Bottom Tray: Fully enclosed base for maximum protection against dust and debris, suitable for sensitive or data cables .
 - Wire Mesh Tray (Basket Tray): Made of welded steel wires forming a grid, offering flexibility and easy cable access .
2. Fittings Fittings allow the cable tray system to change direction, branch, or adjust elevation:

- Horizontal Bends: Change direction on the same plane (e.g., 30°, 45°, 90°), .
- Vertical Bends (Risers): Move the tray between different elevations .
- Tees and Crosses: Create branches to route cables to multiple areas .
- Reducers: Connect trays of different widths, often from a main run to a branch run .

3. Supports Supports anchor the tray system to the building structure and maintain...
