

What does the optical module parameter SR represent

Overview

SR stands for Short Range, these transceivers support link length of 300m over multi-mode fiber and use 850nm lasers. 10GBase-SR is the original multimode optics specification and is still by far the most commonly used. High-speed data transmission in enterprise and data center networks is driven by 10G optical modules. Knowing the key differences, compatible fiber types, and correct. Optical interface naming refers to a standardized shorthand used to describe the optical transmission characteristics of an optical transceiver interface. Some of the major abbreviations are SR, LR, LRM, ER, and ZR. These labels also hint at the typical. Optical transceivers are essential devices in WDM systems. These modules are commonly referred to as SFPs (small form-factor pluggable).
