

What types of multimode optical cables are available

Article Overview

Multimode optical cables are designed for high-speed data transmission over short to medium distances, typically within buildings or campuses. They have a larger core diameter (usually 50 or 62.5 microns), allowing multiple light signals to travel simultaneously, which enables fast and seamless connectivity. There are five main types of multimode fiber, standardized by ISO/IEC 11801: OM1, OM2, OM3, OM4, and OM5, each supporting different data rates and distances. These cables are commonly used in data centers and enterprise networks due to their efficiency in handling high-speed data transport.
