

Wiring method for fiber optic splitter box

Article Overview

Proper wiring of a fiber optic splitter box involves careful cable routing, secure connections, and organized fiber paths to ensure signal integrity and maintainability.

Step 1: Prepare the Splitter Box

- **Mounting:** Install the fiber optic splitter box in its designated location, whether on a wall, rack, or pole. Ensure the box is level and secure, using brackets or screws as needed .
- **Orientation:** Confirm the installation direction to allow easy access to input/output ports and fiber routing paths .
- **Environmental Considerations:** For outdoor boxes, ensure weatherproofing, UV resistance, and proper sealing at cable entry points .

Step 2: Introduce Fiber Cables

- **Cable Entry:** Feed the main fiber optic cable into the box through the designated inlet, using grommets or protective fittings to prevent damage .
- **Cable Preparation:** Strip the outer jacket carefully, clean the fibers, and prepare pigtails or pre-terminated jumpers for splicing or connectorization .
- **Slack Management:** Leave sufficient slack inside the box to allow the front panel or tray to be pulled out without stressing the fibers. Typically, a minimum of 31 inches of cable length is recommended between key points .

Step 3: Connect to the Splitter...
