

Wiring method for indoor distribution box switches

Article Overview

An indoor distribution box typically uses a main double-pole switch or MCB, branch MCBs for individual circuits, and an RCCB for protection, with proper wiring layout and grounding to ensure safety and functionality.

Main Components

- **Main Switch / Main MCB:** Controls the incoming power supply. Usually a double-pole MCB rated 32–63A for residential use (). It connects directly to the incoming phase and neutral wires.
- **RCCB / RCD:** Provides protection against leakage currents and electric shocks. Typically rated at 30mA for domestic installations ().
- **Branch MCBs:** Single-pole MCBs for lighting and socket circuits; double-pole MCBs for special loads like air conditioning ().
- **Busbars:** Copper bars for distributing power to branch MCBs. A comb busbar is recommended for safety and neatness ().
- **Neutral and Earth Bars:** Distribute neutral and earth connections to all circuits ().

Wiring Configuration

- **Input Connections:** Connect the incoming phase and neutral to the main MCB. The output of the main MCB goes to the RCCB input.
- **Branch Connections:** Connect the output of the RCCB to the input of branch MCBs. For double-pole MCBs, connect both phase and neutral; for single-pole MCBs, connect only the phase, with neutral routed to the neutral bar (),...
